

Indian Institute of Sugarcane Research, Lucknow

Contingency Planning and Advisory for 17th July, 2012 Meeting

Crop Status:

Sugarcane crop is nearly 6-8 months old and standing in the field. The weather-based agro-advisory at this stage of the crop particularly for Uttar Pradesh is given below:

1. Crop Production:

- In case of prolonged delayed or drought, life saving light and extensive irrigation should be provided rather than intensive heavy irrigation.
- The remaining dose of N (if delayed due to some reasons) should be given immediately without further delay,
- Earthing up should be done, if not done already.
- In case of water logging in fields due to heavy rainfall, the extra water should be immediately drained out of field.

2. Crop Protection:

- If furadon application has not been done and if moth of top borer is seen, furadon @ 33 kg /ha application should done immediately. This may also control white grub.
- GSD affected clumps of sugarcane, if seen, should be immediately uprooted and destroyed.
- In case spindle infection of red rot is observed, the affected clumps should immediately uprooted and destroyed.
